

## TERRAFLOR

---

### Application

**Terraflor is the latest generation flooring system, specially designed to protect the natural grass pitches of sports stadiums or lawns of gardens and parks during concerts or other mass public events.**

Terraflor is specially designed to leave space between the panels and the grass. This space is light and airy, ideal conditions for grass to remain healthy and green.

Terraflor also prevents contact with any rubbish and ensures that your ground remains pristine clean after the event.

### Properties

Terraflor panels are made up of six individual tiles that are attached to each other. This ensures that the panels adjust to the differences in height in the surface.

The panels are white. This is of essential importance for letting in sufficient light and to reflect the heat for the grass.

The panels are supported on thin plinths so that the grass is free to breath and is not crushed by the weight of the public.

### Delivery options

We supply Terraflor on big pallets measuring 2.25m x 1.5m. This means that delivery and collections require a forklift truck with long forks.

### Laying

For laying Terraflor we use special tools to attach the panels to each other as well as a tractor and different trailers.

When you order Terraflor you automatically hire one of our own supervisors.

A clear co-ordination of the work guarantees speedy installation and dismantling.

## Laying the panels

The Terraflor panels are placed around the grounds with a small tractor and a few trailers.

The panels are laid overlapping each other by two people. The panels are made of a very light material so that laying them is simple and speedy.

To ensure that they all remain neatly in place, the panels are attached to each other. The result looks very neat with the added benefit that you do not need to worry about the condition about your grass.

We can also handle the total assembly, dismantling and final cleaning on request.
